

PORTABLE BATCHING UNIT

Application Sheet #20

CUSTOMER VALUE

SITUATION

- A field operator periodically injects batches of dispersants and warm diesel when wax build ups are detected. Chemical is injected at multiple locations.
- It is important to get to site quickly when build up is detected to minimize additional downtime and maintenance.
- The operator was hiring a third party tank truck to inject small amounts of chemical throughout the field. The cost of this operation was high, and service was typically slow resulting in wax build ups and on-going maintenance.

SOLUTION

- Sirius provided the customer with a portable fifty gallon, AC Fusion chemical injection system designed to fit in the back of a pickup truck.
- The system came complete with 100 feet of chemical hose and 100 feet of power cord allowing the operator to quickly inject once they reached location.

RESULTS

- Prevented unnecessary shut downs and maintenance due to wax buildups.
- Reduced tank truck costs.
- Thousands of dollars saved, and the elimination of a great deal of dirty maintenance.

Thousands of dollars saved, on minimizing downtime and maintenance.
